NEWS	1		Web Page for STN Seminar Schedule - N. America
NEWS	2	OCT 02	CA/Capius enhanced with pre-1907 records from Chemisches Zentralblatt
NEWS	3	OCT 19	BEILSTEIN updated with new compounds
NEWS	4	NOV 15	Derwent Indian patent publication number format enhanced
NEWS	5	NOV 19	WPIX enhanced with XML display format
NEWS	6	NOV 30	ICSD reloaded with enhancements
NEWS	7	DEC 04	LINPADOCDB now available on STN
NEWS	8	DEC 14	BEILSTEIN pricing structure to change
NEWS	9	DEC 17	USPATOLD added to additional database clusters
NEWS	10	DEC 17	IMSDRUGCONF removed from database clusters and STN
NEWS	11	DEC 17	DGENE now includes more than 10 million sequences
NEWS	12	DEC 17	TOXCENTER enhanced with 2008 MeSH vocabulary in MEDLINE segment
NEWS	13	DEC 17	MEDLINE and LMEDLINE updated with 2008 MeSH vocabulary
NEWS	14	DEC 17	CA/Capius enhanced with new custom IPC display formats
NEWS	15	DEC 17	STN Viewer enhanced with full-text patent content from USPATOLD
NEWS	16	JAN 02	STN pricing information for 2008 now available
NEWS	17	JAN 16	CAS patent coverage enhanced to include exemplified prophetic substances
NEWS	18	JAN 28	USPATFULL, USPAT2, and USPATOLD enhanced with new custom IPC display formats
NEWS	19	JAN 28	MARPAT searching enhanced
NEWS	20	JAN 28	USGENE now provides USPTO sequence data within 3 days of publication
NEWS	21	JAN 28	TOXCENTER enhanced with reloaded MEDLINE segment
NEWS	22	JAN 28	MEDLINE and LMEDLINE reloaded with enhancements
NEWS	23	FEB 08	STN Express, Version 8.3, now available
NEWS	24	FEB 20	PCI now available as a replacement to DPCI
NEWS	25	FEB 25	IFIREF reloaded with enhancements
NEWS	26	FEB 25	IMSPRODUCT reloaded with enhancements
NEWS	27	FEB 29	WPINDEX/WPIDS/WPIX enhanced with ECLA and current U.S. National Patent Classification

COPYRIGHT (C) 2009 IFI CLAIMS(R) Patent Services (IFI)

```
=> s l2
L3          6 L2
```

```
=> rem dup l3
DUP IS NOT VALID HERE
The DELETE command is used to remove various items stored by the
system.
```

To delete a saved query, saved answer set, saved L-number list, SDI request, batch request, mailing list, or user-defined cluster, format, or search field, enter the name. The name may include ? for left, right, or simultaneous left and right truncation.

Examples:

```
DELETE BIO?/Q      - delete query names starting with BIO
DELETE ?DRUG/A     - delete answer set names ending with DRUG
DELETE ?ELEC?/L    - delete L-number lists containing ELEC
DELETE ANTICOG/S   - delete SDI request
DELETE ENZYME/B    - delete batch request
DELETE .MYCLUSTER  - delete user-defined cluster
DELETE .MYFORMAT   - delete user-defined display format
DELETE .MYFIELD    - delete user-defined search field
DELETE NAMELIST MYLIST - delete mailing list
```

To delete an ordered document or an offline print, enter its number.

Examples:

```
DELETE P123001C    - delete print request
DELETE D134002C    - delete document order request
```

To delete an individual L-number or range of L-numbers, enter the L-number or L-number range. You may also enter DELETE LAST followed by a number, n, to delete the last n L-numbers. RENUMBER or NORENUMBER may also be explicitly specified to override the value of SET RENUMBER.

Examples:

```
DELETE L21         - delete a single L-number
DELETE L3-L6       - delete a range of L-numbers
DELETE LAST 4      - delete the last 4 L-numbers
DELETE L33-        - delete L33 and any higher L-number
DELETE -L55        - delete L55 and any lower L-number
DELETE L2-L6 RENUMBER - delete a range of L-numbers and
                    renumber remaining L-numbers
DELETE RENUMBER    - renumber L-numbers after deletion of
                    intermediate L-numbers
```

Entire sets of saved items, SDI requests, batch requests, user-defined items, or E-numbers can be deleted.

Examples:

```
DELETE SAVED/Q     - delete all saved queries
DELETE SAVED/A     - delete all saved answer sets
```

DELETE SAVED/L - delete all saved L-number lists
 DELETE SAVED - delete all saved queries, answer sets,
 and L-number lists
 DELETE SAVED/S - delete all SDI requests
 DELETE SAVED/B - delete all batch requests
 DELETE CLUSTER - delete all user-defined clusters
 DELETE FORMAT - delete all user-defined display formats
 DELETE FIELD - delete all user-defined search fields

 GI 11 Figure(s).
 FIG. 1 is a confocal photomicrograph of a plucked hair having
 adhered epidermal stem cells. The epidermal stem cells are revealed by
 their uptake of a fluorescently labeled antibody to the CD200 cell
 surface protein.
 FIG. 2 is a confocal photomicrograph of a plucked hair that has
 been incubated in vitro with follicular dermal cells double labeled with
 fluorescently labeled antibodies to the CD73 (orange) and CD90 (green)
 cell surface proteins. CD90 labels all types of dermal cells. CD73 is a
 known marker for mesenchymal stem cells.
 FIG. 2a (inset) is a confocal photomicrograph showing the population of
 cells in which the plucked hair of FIG. 2 was incubated.
 FIG. 3 is a photograph of the underside of skin of a SCID mouse at the
 site of implantation of a traditional human scalp follicular unit
 hair graft comprised of 2 hairs.
 FIG. 3a (inset at right) is a photograph of the same two hair
 shafts growing from the human hair graft implantation
 as seen on the surface of the SCID mouse skin.
 FIG. 3b (inset at left) is a photograph of a typical plucked hair
 having adhered epidermal stem cells.
 FIG. 4 is a photograph of a plucked hair prior to implantation
 partially loaded into a 27 gauge hypodermic needle. The protruding end of
 the hair in the needle has a "club" end. Several other hairs
 with similar club ends are shown after implantation where the club ends

are now buried beneath the skin.
 FIG. 5 is a photograph of the hypodermic needle, loaded with a plucked hair and saline solution that has been injected into the skin and withdrawn slightly.
 FIG. 6 is a photograph of a plucked hair that has been properly implanted.
 FIG. 7 is an H&E stained histological section of biopsied pig skin at the site where trichogenic newborn pig (same-breed) skin cells were implanted at the interface between the fat and the dermis. A plucked hair devoid of living cells was implanted with the trichogenic cells.
 FIG. 8 is a photograph of an implanted plucked hair, having adhered epidermal stem cells and associated follicular dermal cells, placed under the skin of a nu/nu mouse for 20 weeks.

GI 16 Figure(s).

FIG. 1 is a cross-sectional schematic representation of a hollow filament of the present invention showing a solid outer filament (1) of bioabsorbable polymer, a porous inner filament (2) of the same or different bioabsorbable polymer, and a central lumen (3).

FIG. 2 is a cross-sectional schematic representation of the hollow filament of FIG. 1 showing cells (4) (e.g. keratinocytes) that have been seeded into the porous inner filament by wicking a suspension of cells into the lumen of the filament and a clump of cells (5) (e.g. cultured dermal papilla cells or a hair follicle fragment) that has been seeded into the lumen of the filament by mechanically forcing it into an open end of the filament.

FIG. 3 is a cross-sectional schematic representation of the filament of FIG. 2 shortly after implantation in the skin such that the proximal end (6) is in the dermis (7) and the distal end (8) is surrounded by down-grown epidermis (9).

FIG. 4 is a scanning electron micrograph (SEM) of a hollow filament of the present invention made of a porous copolymer of d,l-lactide and glycolide (PLGA).

FIG. 5 is an SEM of the porous inner surface of the hollow filament of FIG. 4, which was exposed by cutting open the tube.

FIG. 6 is a light photomicrograph showing a filament (10) with the construction shown in FIG. 1 wherein the outer filament (1) is made of solid PLGA and the porous inner filament (2) is made of crosslinked hyaluronic acid (HAX). FIG. 6 also shows a filament (11) made of PLGA containing no HAX. Both filaments were placed on a drop of water (12) colored red with food color dye. The PLGA only fiber (11) floated on the top of the water and did not wick any water into the lumen of the fiber, whereas the HAX-containing PLGA fiber (10) rapidly wicked the water into the lumen, giving the fiber a red color.

FIG. 7(A) is a photograph of a mouse vibrissa (whisker) follicle (13) and a PLGA hollow filament (14) with an inside diameter of sufficient size to accommodate the excised follicle.

FIG. 7(B) is a photograph of the PLGA hollow filament of FIG. 7(A) with the follicle (13) inserted into the lumen.

FIG. 8 is a photograph of a mouse whisker (15) that was observed growing on the back of a mouse against the background of regrown shaved pelage hair (16) 30 days post-implantation of a vibrissa follicle contained in a PLGA hollow filament.

FIG. 9 is a photomicrograph of a hair follicle bulb (17) and hair shaft (18) growing under the skin of a mouse 30 days postimplantation of a mixture of cells obtained from neonatal mouse skin contained in a PLGA hollow filament (19).

FIG. 10 is a side-by-side comparison of two photomicrographs taken at the same magnification of the underside of skin excised from a nude mouse that had been injected 13 days previously with cells obtained from newborn black mouse epidermis and dermis. Panel A shows the control injection site and panel B shows the injection site containing exactly the same number of cells except that the injection fluid also contained 5% (w/v) of chondroitin-6-sulfate, which resulted in the neogenesis of hair follicles that are larger and more numerous than the control.

FIG. 11 also is a side-by-side comparison of two photomicrographs taken at the same magnification of the underside of skin excised from a nude mouse that had been injected 13 days previously with cells obtained from newborn black mouse epidermis and dermis. Panel A shows the same control injection site of FIG. 10 and panel C shows the injection site in the same mouse containing exactly the same number of cells except that the injection fluid also contained 20% (w/v) of Pluronic (TM) F-127 surfactant (a copolymer of ethylene and propylene oxides), which resulted in the neogenesis of hair follicles that are larger than those in the control.

FIG. 12 is a cross-sectional schematic representation of a hollow filament of the present invention in which the lumen (20) is slightly tapered to a closed end (21) attached to a porous plug (22).

FIG. 13 is a cross-sectional schematic representation of a hollow filament of the present invention showing a fine pipette tip (23) containing cells (24) and fluid (25) that has been inserted into the tapered lumen (20).

FIG. 14 cross-sectional schematic representation of a hollow filament of the present invention showing a suspension of fluid (25) and cells (24) being expelled from a pipette tip (23) whereby the cells collect in the closed end of the lumen (21) and the fluid (25) is fully absorbed in the porous plug (22).

FIG. 15 is a photograph of the hollow filament scaffold of Example 10 and a 10-microliter pipette tip (26) identical to the one that was used as a mandrel in the process for making this embodiment of the present invention. The sheath (27) is made of PLGA and the fibrous mass (28) contained in the bulbous tip (29) is made of crosslinked gelatin/chondroitin-6-sulfate filaments. Charcoal particles (30) collected in the proximal portion of the fibrous scaffold upon injection of a slurry of charcoal particles and water into the scaffold through a pipette tip inserted into the scaffold sheath.
